#### Strategy

software

- Data structures involving pointers formalized with relations, functions.
- Specific axioms of these specific data structures give *properties* of these functions that model the data structures.
- Specific forms of these axioms (capturing induction on the data structures) are well-suited to be used in automated proofs.
- We will focus on formalizing:
  - Infinite lists.
  - Finite lists.
  - Infinite trees.
  - Finite trees.

- Initial node f. axm 1 :
- Bijective *next* function

 $\begin{array}{ll} \mathsf{axm\_1:} & f \in V \\ \mathsf{axm\_2:} & n \in V \rightarrowtail V \setminus \{f\} \end{array}$ 

Note: isomorphic to natural numbers with  $V = \mathbb{N}$ , f = 0, n = succ.

### **Avoiding cycles**

Avoiding cycles

- If a list has a cycle, then there is a  $S \subseteq V$  s.t.  $S \subseteq n[S]$ .
- On the other hand, it is always the case that  $\emptyset \subseteq n[\emptyset]$ .
- So we insist that this is the only case:

 $\mathsf{axm}_3: \forall S \cdot S \subseteq V \land S \subseteq \mathsf{n}[S] \Rightarrow S = \emptyset$ 

• It can be used to prove properties in infinite lists.

0

3

T

VNT

From absence of cycles to induction

$$S \subseteq m[S] \rightarrow V \setminus T \subseteq m[V \setminus T] = m[V] \setminus m[T]$$
  
By definition:  $f \in V$ ,  $f \notin m[V \setminus T]$   
Since  $V \setminus T \subseteq m[V \setminus T]$ ,  $f \notin V \setminus T$   
Therefore  $f \in T$  so that  $f \notin V \setminus T$   
And  $m[V] = V \setminus \{g\}$

If we expand  $n[T] \subseteq T$ :

thm\_2: 
$$\forall T \cdot f \in T \land (\forall x \cdot x \in T \Rightarrow n(x) \in T) \Rightarrow V \subseteq T$$

• *T* the set of elements with some property *P*:  $T = \{x | P(x)\}$ 

If:

- Initial node f has the property ( $f \in T$ ), and
- For every element with the property (x ∈ T), the next one has this property (n(x) ∈ T), then
- All elements have the property ( $V \subseteq T$ ).
